

STATE FORENSIC TOXICOLOGY LABORATORY

TOXICOLOGY REPORT

Laboratory Case Number:	TOX-2024-11-4287
Medical Examiner Case:	ME-2024-003-NAT
Decedent:	CONFIDENTIAL
Age/Sex:	58-year-old Male
Date of Death:	November 28, 2024
Date Specimens Received:	November 29, 2024
Date Analysis Completed:	November 30, 2024
Toxicologist:	Dr. Lisa Chen, PhD, DABFT
Laboratory Director:	Dr. Robert Martinez, PhD, DABFT

SPECIMENS RECEIVED

The following postmortem specimens were received:

- Femoral blood (20 mL)
- Heart blood (15 mL)
- Urine (25 mL)
- Vitreous humor (5 mL)
- Gastric contents (minimal)

ANALYSES PERFORMED

- Volatile analysis (GC-FID)
- Immunoassay drug screening

- GC-MS and LC-MS/MS confirmatory testing
- Carbon monoxide analysis

TOXICOLOGY FINDINGS

Alcohol Analysis

Ethanol: NEGATIVE in all specimens tested. Blood alcohol concentration: 0.00%

Drug Screening Results

Drug Class/Substance	Result
Amphetamines	NEGATIVE
Benzodiazepines	NEGATIVE
Cannabinoids	NEGATIVE
Cocaine	NEGATIVE
Opioids/Opiates	NEGATIVE
Barbiturates	NEGATIVE
Phencyclidine	NEGATIVE
Methadone	NEGATIVE

Pharmaceutical Screening

Comprehensive pharmaceutical screening was performed for common prescription medications including: cardiovascular drugs, antidepressants, antipsychotics, anticonvulsants, anticoagulants, and other therapeutic agents.

Result: NEGATIVE - No prescription medications detected

Additional Testing

Test	Result
Carbon Monoxide	NEGATIVE (<5% COHb)

Cyanide	NEGATIVE
Heavy Metals	NEGATIVE

INTERPRETATION

Comprehensive toxicological analysis reveals no alcohol, drugs of abuse, prescription medications, or toxic substances. The negative findings for all tested substances indicate that intoxication, poisoning, or adverse drug effects did not contribute to death.

The absence of prescription cardiovascular medications (such as antihypertensive agents or statins) in the toxicology results, despite medical records indicating these were prescribed, suggests the decedent may not have been taking his medications as prescribed. This is consistent with pharmacy records showing inconsistent refills and supports suboptimal management of cardiovascular risk factors.

The toxicology results exclude toxic or pharmacological causes of death and support the conclusion that death resulted from natural cardiovascular disease without contribution from drugs, alcohol, or toxins.

CONCLUSION

No ethanol, drugs of abuse, prescription medications, or toxic substances detected. The toxicological findings are negative and do not contribute to or explain the cause of death, which is attributable to natural cardiovascular disease as documented in the autopsy report.
